

Total:  $O(n^2)$ 

Next we determine the cost at each level of the tree. Each level has three times more nodes than the level above, and so the number of nodes at depth i is  $3^{i}$ . Because subproblem sizes reduce by a factor of 4 for each level we go down from the root, each node at depth i, for  $i = 0, 1, 2, \dots, \log_4 n - 1$ , has a cost of  $c(n/4^i)^2$ . Multiplying, we see that the total cost over all nodes at depth i, for  $i = 0, 1, 2, \dots, \log_4 n - 1$ , is  $3^i c(n/4^i)^2 = (3/16)^i cn^2$ . The bottom level, at depth  $\log_4 n$ , has  $3^{\log_4 n} = n^{\log_4 3}$  nodes, each contributing cost T(1), for a total cost of  $n^{\log_4 3}T(1)$ , which is  $\Theta(n^{\log_4 3})$ , since we assume that T(1) is a constant.

Now we add up the costs over all levels to determine the cost for the entire tree:

$$T(n) = cn^{2} + \frac{3}{16}cn^{2} + \left(\frac{3}{16}\right)^{2}cn^{2} + \dots + \left(\frac{3}{16}\right)^{\log_{4}n - 1}cn^{2} + \Theta(n^{\log_{4}3})$$

$$= \sum_{i=0}^{\log_{4}n - 1} \left(\frac{3}{16}\right)^{i}cn^{2} + \Theta(n^{\log_{4}3})$$

$$= \frac{(3/16)^{\log_{4}n} - 1}{(3/16) - 1}cn^{2} + \Theta(n^{\log_{4}3}) \qquad \text{(by equation (A.5))}.$$

This last formula looks somewhat messy until we realize that we can again take advantage of small amounts of sloppiness and use an infinite decreasing geometric series as an upper bound. Backing up one step and applying equation (A.6), we have

$$T(n) = \sum_{i=0}^{\log_4 n - 1} \left(\frac{3}{16}\right)^i cn^2 + \Theta(n^{\log_4 3})$$

$$< \sum_{i=0}^{\infty} \left(\frac{3}{16}\right)^i cn^2 + \Theta(n^{\log_4 3})$$

$$= \frac{1}{1 - (3/16)} cn^2 + \Theta(n^{\log_4 3})$$

$$= \frac{16}{13} cn^2 + \Theta(n^{\log_4 3})$$

$$= O(n^2).$$
For real  $x \neq 1$ , the summation
$$\sum_{k=0}^{n} x^k = 1 + x + x^2 + \dots + x^n$$
is a geometric or exponential series and has the value
$$\sum_{k=0}^{n} x^k = \frac{x^{n+1} - 1}{x - 1}.$$
When the summation is infinite and  $|x| < 1$ , we have metric series
$$\sum_{k=0}^{\infty} x^k = \frac{x^{n+1} - 1}{x - 1}.$$

$$\sum_{k=0}^{n} x^{k} = 1 + x + x^{2} + \dots + x^{n}$$

$$\sum_{k=0}^{n} x^k = \frac{x^{n+1} - 1}{x - 1} \,. \tag{A.5}$$

When the summation is infinite and |x| < 1, we have the infinite decreasing geo-

$$\sum_{k=0}^{\infty} x^k = \frac{1}{1-x} \,. \tag{A.6}$$
